TRASCO® couplings

Description

TRASCO® flexible couplings consist of two metal hubs and an elastic gear ring which is resistant to oils, chemical agents and heat. The construction allows safe power transmission between driver and driven shafts, absorbing impact loads, and torsional vibrations.

In its class TRASCO® coupling transmits more power in relation to the physical space occupied.

It has a very compact design and allows safe power transmission by absorbing peak loads and torsional vibrations.

Moreover, the elastic deformation of the polyurethane gear ring compensates angular and radial misalignments and also absorbs

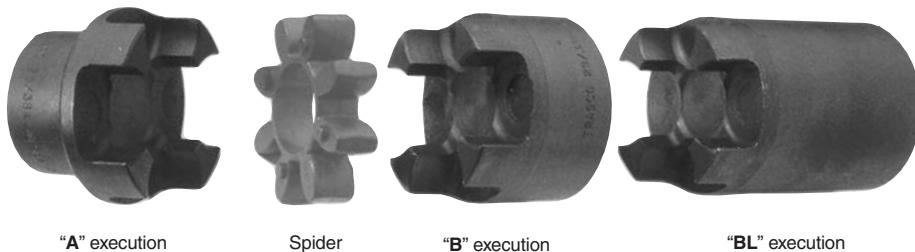

small shaft length variation.

The involute profile of the gear ring teeth prevents high stress concentration on reduced surfaces and the crowned profile avoids the transmission of axial stress.

The high duty factor of TRASCO® couplings is due to the fact that the elastic element works under compression and never under flexion.

TRASCO® couplings are suitable for working in both horizontal and in vertical positions and easily support any load variation or reversal. The two coupling halves are electrically insulated from each other.

TRASCO®

“A” execution

Spider

“B” execution

“BL” execution

ATEX 94/9/EC compliance

It is possible to ask for specific certification for use in hazardous area according to EC standard 94/9/EC. TRASCO couplings are

available with specific mounting/operating instruction manual and conformity. For information, please contact our technical office.

Hubs are available in cast iron GG25, die cast aluminum alloy or forged aluminum.

Special request hubs are available in steel or cast iron GGG40. In the base execution, “GR” TRASCO® couplings are available in two different versions: precision “P” or economy “S”.

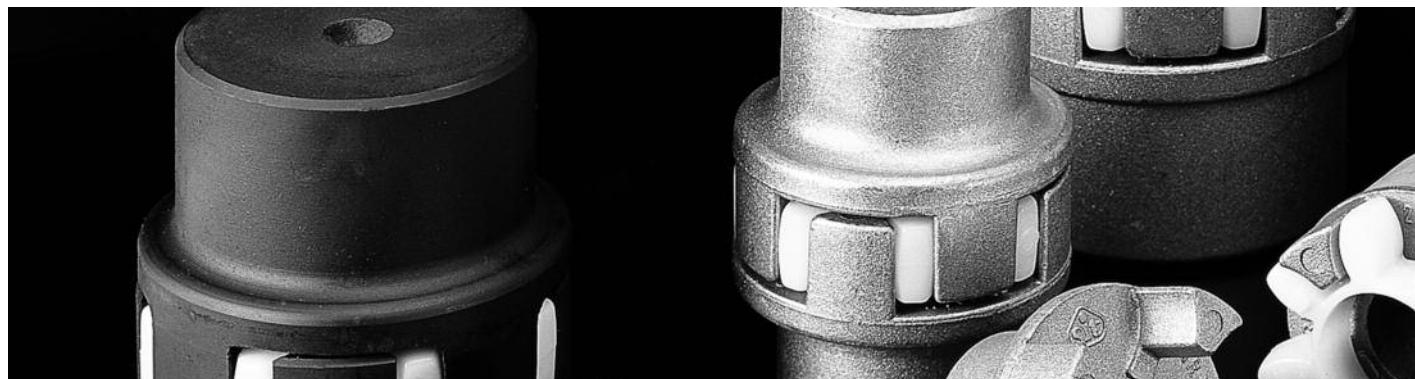

In all other executions, only the precision type is manufactured.

The difference between “P” and “S” type hubs is that in the precision execution the circular sections of the hubs are precision machined, while in the economy execution, they are simply

deburred.

The “S” version allows lower axial displacement as indicated in the technical performance table. Each hub is available in two types “A” and “B”, which can accommodate maximum bore size in mm corresponding respectively to the first and second number of the coupling designation.

Besides the various executions shown in the catalogue, it is always possible to manufacture coupling hubs for special applications.

Spider

The gear ring is made of a particular polyurethane resin which shows great advantages in comparison to the standard polyurethanes on the market.

In fact it is very resistant to aging and hydrolysis (therefore, also suitable for tropical climates) as well as fatigue proof and abrasion proof. It is self-dampening and shows a great resistance

to the main chemical agents, acids, oils, and ozone. Special types of gear rings are available in order to provide the right solution for each specific application covering a large range of temperatures and resisting specific chemical agents.

| Standard spiders | | | | | |
|------------------|--------|--------------|-----------------------------|--------------------|--|
| (Shore) | Colour | Compound | Admissible Temperature [°C] | | Applications |
| | | | on work | peaks | |
| 92 Sh A | Yellow | Polyurethane | from - 40 to + 90 | from - 50 to + 120 | • the most of industrial application (low-mid power) |
| 98 Sh A | Red | Polyurethane | from - 30 to + 90 | from - 40 to + 120 | • high torque – narrow angular misalignment – torsion rigidity |
| 64 Sh D | Green | Polyurethane | from - 30 to + 110 | from - 30 to + 130 | • damped areas – internal combustion engines |

| Spiders for special applications | | | | | |

| (Shore) | Colour | Compound | Admissible Temperature [°C] | | Applications |
| | | | on work | peaks | |
| 94 Sh A-T | Orange | Polyurethane | from - 50 to + 110 | from - 60 to + 130 | • internal combustion engines / high dynamic solicitations / highly damped areas |
| 64 Sh D-H | Green | Hytrex | from - 50 to + 110 | from - 60 to + 150 | • high solicitation applications / high torsion rigidity / high temperature areas |
| PA | White | Polyurethane | from - 20 to + 110 | from - 30 to + 150 | • high torsion rigidity / high temperature areas / high resistance |

TRASCO® coupling sizing as per DIN 740/2

TRASCO® coupling sizing is made according to DIN 740/2. Couplings must be selected to ensure that the max feasible torque is never exceeded during operation.

It is necessary to have correct sizing, so that all conditions hereunder are respected.

1) Verify the nominal torque

The nominal torque of the coupling must be higher or equal to the nominal torque of the drive multiplied by the temperature safety factor.

$$T_{KN} \geq T_N \cdot S_\theta \quad [\text{Nm}]$$

Note that:

$$T_N = 9550 \frac{P_N}{n} \quad [\text{Nm}]$$

Where P_N is the motor nominal power in kW.

2) Verify the maximum torque

The max torque of the coupling must be higher or equal to the starting torque T_s multiplied by the safety factors S_θ , S_z , S_u where S_u is the higher value between driver and driven units.

$$T_{Kmax} \geq T_s \cdot S_\theta \cdot S_z \cdot S_u \quad [\text{Nm}]$$

3) Verify torque with reversal

In case of torque with reversals it must be verified that:

$$T_{KW} \geq T_W \cdot S_\theta \quad [\text{Nm}]$$

where T_{KW} = torque with reversal, which the coupling can bear, and T_W = torque variation of the drive.

In case of drives with high torsional vibrations (eg. piston compressors, combustion engine) it is recommended to make a torsional vibration calculations in order to guarantee the correct functioning of the coupling. Please consult our technical office.

Shock load safety factor

| Shock load type | S_u |
|-----------------|-------|
| Light | 1,4 |
| Medium | 1,5 |
| Hard | 1,8 |

Temperature safety factor

| T (°C) | -30°C / +30°C | +40°C | +60°C | +80°C |
|------------|---------------|-------|-------|-------|
| S_θ | 1 | 1,2 | 1,4 | 1,8 |

Safety factor for frequency of starting

| Starting/h | 0÷100 | 101÷200 | 201÷400 | 401÷800 |
|------------|-------|---------|---------|---------|
| S_z | 1 | 1,2 | 1,4 | 1,6 |

Hub shaft connection check

Hub shaft connection must always be checked by the user. It is important to verify the maximum torque in the drive is lower than the torque which the hub shaft connection can bear. In case of keyway connection, it is important to verify the tensile strength of the hub material with the load which the keyway seat must transmit.

| | | |
|----------|--|----|
| color | Coupling nominal torque | Nm |
| T_{KN} | Coupling maximum torque | Nm |
| T_{KW} | Torque with reversal transmissible by the coupling | Nm |
| T_N | Motor nominal torque | Nm |

n=1500 min⁻¹

The values shown in the table for radial and angular misalignment, must be corrected in case they are simultaneously acting on the coupling.

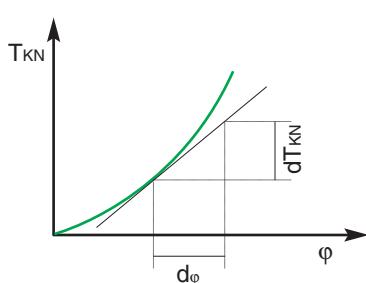

The sum of the admissible value (A) and the respective values shown in the table must be lower or equal to 1.

$$\frac{\Delta K_{rA}}{\Delta K_r} + \frac{\Delta K_{wA}}{\Delta K_w} \leq 1$$

| | | |
|-----------------|--|----|
| ΔK_{aP} | Maximum axial misalignment - "P" execution | mm |
| ΔK_{aS} | Maximum axial misalignment - "S" execution | mm |
| ΔK_r | Maximum radial misalignment | mm |
| ΔK_w | Maximum angular misalignment | ° |

Dynamic torsional rigidity

Dynamic torsional rigidity C_{Tdin} is the first derivative of the nominal torque of half coupling in respect to the torsion angle. φ is the torsion angle of half coupling in respect to the second half.

As a general rule, C_{Tdin} is greater than C_T and depends on the stress acting on the coupling.

Technical performances

The technical performances below refer to all types of TRASCO® executions and are valid for the indicated spiders when couplings are correctly selected.

For particular applications needed, such as very high chemical resistance, spiders made of special material are available. Contact our Technical Department.

"GR" base program

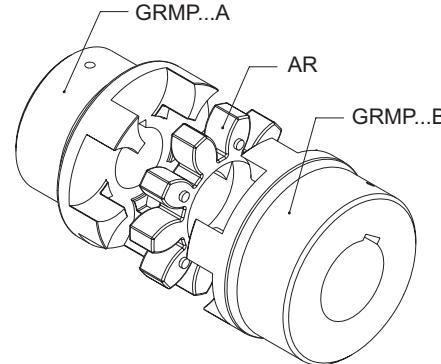

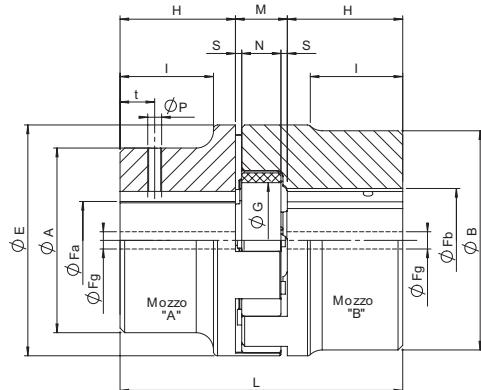

TRASCO® couplings are dimensionally manufactured to hub types "A" and "B", the difference being the maximum shaft diameter which hubs can accept (corresponding respectively to the first and second code number).

The long hub execution "L" (allows full cover of the motor shaft) is

available in both "A" and "B" executions.

Materials used for manufacture are:

- cast iron grade GG25 (all sizes);
- aluminum, diecasting
- cast iron grade GGG40 and steel upon request.

“GRB” taper bush series

TRASCO® couplings type GRB are manufactured in cast iron GG25. They combine the typical high performances of standard couplings with the mounting and dismounting advantages offered by the SER-SIT® taper bush:
 -they are ready to be mounted;
 -they are manufactured in two different executions:

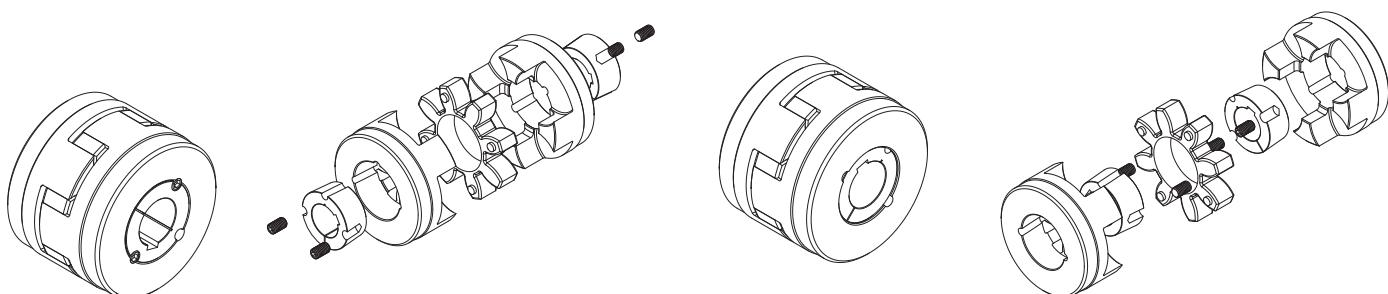

B1 and B2 (see picture);

- they solve the problem of fighting corrosion;
- hubs type B1 may be axially moved for spider replacement;
- they may be used in all types of machinery.

“GRCAL” series for use with SIT-LOCK® elements type 8

This execution has been introduced to incorporate advantages offered by the SIT-LOCK® locking elements in the shaft-hub connection.

The system allows for a quick, safe and backlash free mounting without the use of keyway and eliminating the need for lock

washers, spacers and stop rings.

Many different solutions may be created to solve all kinds of application needs.

We include hereunder a very useful example. In fact, the same hub bore allows the fitting of different shaft diameters.

“GRL” series with intermediate shaft

This series allows the joining of two shafts (even very distant) through two TRASCO® couplings and an intermediate shaft (length “Lw”) of customized dimension.

The presence of two polyurethane rings allows high dampening

capability and large radial misalignments. Hubs are classically made from cast-iron, while shafts are from steel; though, different materials can be used, according to different applications.

This series allows the joining of two shafts (even two spaced) through two TRASCO® couplings and an intermediate shaft (length “L_{R2}”) of customized dimension, fixed with hubs through shrink-disc.

The presence of two polyurethane elements allows high

dampening capability and large radial misalignments. Hubs are classically made of cast-iron, while shafts are made of steel; though different materials can be used according to different applications.

“GRF” flange series

This series, with flanges, has been developed for applications on heavy machinery and to combine different shafts and flanges solutions.

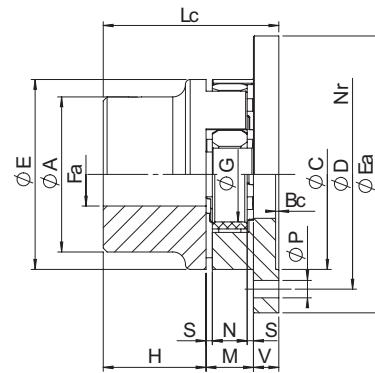

- Shaft-shaft: using two hubs type “BF”, allows the replacement of

the elastic element without traversing of either motor-machine or driven-machine.

- Shaft-flange: using one hub type “CF” and one type “GR”.
- Flange-Flange: using two hubs type “CF”.

“GRS” double cardanic series

It allows compensation of high axial, radial and angular misalignment. Moreover, the use of the double spider allows for

double the torsion angle and provides very high dampening effect.

"GR FRT" drum brake series

This series has been developed to suit drum-brake (FRT) transmissions.

It is constituted as an elastic coupling screwed to the brake band. Components are either made of cast-iron (G25), spheroidal

cast-iron (GS400), or steel according to application. Also, assembling of different dimensioned brake bands to any kind of coupling is allowed. See below tables.

Weight and moments of inertia are calculated on hubs with max diameter bore.

Tables for TRASCO® couplings with taper or splined bores

Taper 1:5 per:

BOSCH - BUCHER- LEDUC - DÜSTERLOH

| Code | $\phi d + 0,05$ | b JS9 | $t2 + 0,1$ | lk |
|------|-----------------|-------|------------|------|
| a1 | 9,85 | 2 | 1 | 11,5 |
| a2 | 16,85 | 3 | 1,8 | 18,5 |
| a3 | 19,85 | 4 | 2,2 | 21,5 |
| a4 | 21,95 | 3 | 1,8 | 21,5 |
| a5 | 24,85 | 5 | 2,9 | 26,5 |
| a6 | 29,85 | 6 | 2,6 | 31,5 |
| a7 | 34,85 | 6 | 2,6 | 36,5 |
| a8 | 39,85 | 6 | 2,6 | 41,5 |

Taper 1:8 per:

ATOS - CASAPPA - GARBE LAHMEYER - JOTTI & STROZZI
MARZOCCHI - SALAMI - SAUER-FLUID

| Code | $\phi d + 0,05$ | b + 0,05 | $t2 + 0,1$ | lk |
|------|-----------------|----------|------------|------|
| b1 | 9,7 | 2,4 | 6 | 17 |
| b2 | 11,6 | 3 | 7,1 | 16,5 |
